

OOPL

1. Write a java program that contains a zero-arg constructor, one static block and two instance blocks and creates an object and show the execution sequence of this code.
2. Write a java program to illustrate the concept of Default Constructor, Parameterized Constructor, Copy Constructor, and Constructor Overloading by designing a class "Complex".
3. Write a java program that implements constructor chaining.
4. Write a java program that reads an integer or a float number and returns the absolute value of that given input number. (use the concept of method overloading)
5. Write a java program that overloads the volume function that returns the volume of square box and rectangular box.
6. Write a java program that overloads the product function that can multiply two integers / one integer and one float / one double and one long.
7. Write a java program that can exchange the value of two integers, two floats and two doubles (use the concept of method overloading)
8. Write a java program that overloads the area function and returns the area of square, rectangle.
9. Write a java program that overloads the difference function and returns the difference of two integers / one integer and one float / one double and one long taken as user input.
10. Write a java program that overloads the square function that prints the square value of an integer or a float or a long input value.
