

OOPL

1. WAP to swap two values using call by value in JAVA.
2. Create a class box with three member variables width, height and depth. Also create a member function to initialize member variables. Now write another member function to calculate the volume of box and print the result in main function.
3. Create a class named BankAcc having two member variables name and balance. Use relevant method to take input for the data members. Write two other member functions for the purpose of deposit and withdrawal. Also check at the time of withdrawal whether the withdrawal amount is less than the bank balance and if it is then print “insufficient balance”.
4. Write a program to demonstrate non-static members of a class.
 - a) Access within the same class as main function belongs to.
 - b) Access from a different class.
